Improving surgical care and outcomes in Older cancer Patients Through Implementation of an efficient pre-Surgical toolkit (OPTI-Surg)
Study Team

- George J Chang MD, MS: MD Anderson Cancer Center (gchang@mdanderson.org)
- Daniel Dohan PhD: University of California, San Francisco (daniel.dohan@ucsf.edu)
- Amylou Dueck PhD: Mayo Clinic (dueck.amylou@mayo.edu)
- Emily Finlayson MD, MS: University of California, San Francisco (emily.finlayson@ucsf.edu)
- Lisa Lowenstein PhD, MPH, RD: MD Anderson Cancer Center (lmlowenstein@mdanderson.org)
- Supriya Mohile MD, MS: University of Rochester (Supriya_mohile@urmc.rochester.edu)
Frail older adults are at risk for poor surgical outcomes due to conditions including malnutrition, cognitive/functional impairment, depression, and social vulnerability.

Multimodal interventions to optimize the components of frailty can decrease postop complications, reduce hospital length of stay, and increase likelihood of return to baseline function.

Most surgeons do not routinely screen for or attempt to improve these conditions prior to surgery.
Specific Aims

- **Aim 1:** To measure the impact of a targeted pre-surgical frailty optimization intervention on practice-level rates of postoperative morbidity and return to baseline function among at risk patients.

- **Aim 2:** To assess the uptake and implementation of the OPTI-Surg package with practice level rates of 1) completion of the brief assessment for all older surgical patients; 2) subsequent referral for the indicated optimization intervention and determine practice-level structural factors associated with uptake of the OPTI-Surg package.

- **Aim 3:** To document and assess barriers and facilitators to implementation and dissemination through qualitative analysis.
**OPTI-Surg Toolkit**

- **Design Requirement:** an efficient, validated measure of frailty that identifies distinct syndromes that are potential targets for pre-operative optimization
The Edmonton Frail Scale

</table>

Totals: Final score is the sum of column totals

SCORING:
0 - 5 = Not Frail
6 - 7 = Vulnerable
8 - 9 = Mild Frailty
10-11 = Moderate Frailty
12-17 = Severe Frailty

**OPTI-Surg Toolkit**

- **Edmonton Frail Scale**: an efficient, validated measure of frailty that identifies distinct syndromes that are potential targets for pre-operative optimization

- **Preoperative Intervention**: one of 2 options to be selected based on site-specific available resources
  - **Low intensity**
    - Printed materials/checklists
    - ACS resources/help lines
    - PCP referral
  - **High intensity**
    - Referrals: geriatrics, palliative care, occupational therapy, physical therapy, nutrition, social work, mental health provider
Methods

- Multicenter cluster randomized trial within the NCORP CCDR surgical practices to evaluate the implementation of a pre-surgical care improvement package (*OPTI-Surg* Toolkit) that will:
  1. Identify frail patients
  2. Recommend targeted pre-op interventions aimed at improving individual vulnerabilities prior to major cancer surgery
**Study Schema**

**Eligible sites**

**Randomize**

**Usual care**

**OPTI-Surg**
- Group 1
  - No Coach
- Group 2
  - Coach

**PATIENT SELECTION**
Age >64
Major cancer surgery (e.g. cystectomy, colorectal resection, esophagectomy, gastrectomy, hepatectomy, pancreatectomy, pulmonectomy)

**SITE ELIGIBILITY**
##
Implementation Plan

- Implementation checklists will be used to assess the process of implementation between the sites with and without the coach
  - Check-ins with sites will be used to determine what has been done to implement **OPTI-Surg**

- Organizational Readiness to Change Assessment
  - Coach’s will use the baseline results to tailor strategies for implementation

- Uptake of the **OPTI-Surg** will be assessed by tracking the number of eligible patients receiving the assessment and the subsequent referral by reviewing chart reviews

- Assessing practice-level structural factors associated with uptake
Qualitative Methods

- Initial site visit prior to randomization to assess organizational readiness for change
  - Qualitative interviews with key stakeholders
  - Observation of selected clinic meetings
  - Readiness for change validated survey

- 2 follow-up site visits to assess implementation of **OPTI-Surg** (at intervention sites) or document secular trends (at control sites)
  - Qualitative interviews and observational protocols are repeated

- Analysis plans
  - Qualitative case studies of implementation experiences focused on barriers and facilitators to **OPTI-Surg** adoption
  - Provide context to interpret main trial results
Discussion

Thank You!
